COMPUTER SCIENCE MENTORS 61A

February 29 to February 26, 2016

1. (H)OOP

Given the following code, what will Python output for the following prompts?

```
class Baller:
    all_players = []
    def __init__(self, name, has_ball = False):
        self.name = name
        self.has_ball = has_ball
        Baller.all_players.append(self)

    def pass_ball(self, other_player):
        if self.has_ball:
            self.has_ball = False
            other_player.has_ball = True
            return True
        else:
            return False

class BallHog(Baller):
    def pass_ball(self, other_player):
        return False

>>> tiffany = Baller('Tiffany', True)
>>> garrett = BallHog('Garrett')
>>> len(Baller.all_players)

>>> Baller.name

>>> len(garrett.all_players)
```

```
>>> tiffany.pass_ball()

>>> tiffany.pass_ball(garrett)

>>> tiffany.pass_ball(garrett)

>>> BallHog.pass_ball(garrett, tiffany)

>>> garrett.pass_ball(tiffany)

>>> garrett.pass_ball(garrett, tiffany)
```

2. **TeamBaller** Write `TeamBaller`, a subclass of `Baller`. An instance of `TeamBaller` cheers on the team every time it passes a ball.

Hint: What can we use to avoid writing duplicate code?

“Super” Hint: There are two ways to implement `pass_ball`

```
>>> cheerballer = TeamBaller('Susanna', has_ball=True)
>>> cheerballer.pass_ball(garrett)
Yay!!!!
True
>>> cheerballer.pass_ball(garrett)
I dont have the ball :(
False
```

```
class TeamBaller(_____):
    def pass_ball(_____, _____):
```

3. **Nonlocal Kale** Draw the environment diagram for the following code.

```

eggplant = 8
carrot = 0
def vegetable(kale):
    carrot = 10
    def eggplant(spinach):
        nonlocal eggplant
        nonlocal kale
        kale = 9
        carrot = 20
        eggplant = spinach
    eggplant(kale)
    return eggplant
spinach = vegetable(lambda kale: carrot*kale)(eggplant)

```

4. **Pinpong again...**

Recap of ping-pong: The ping-pong sequence counts up starting from 1 and is always either counting up or counting down. At element k , the direction switches if k is a multiple of 7 or contains the digit 7. The first 30 elements of the ping-pong sequence are listed below, with direction swaps marked using brackets at the 7th, 14th, 17th, 21st, 27th, and 28th elements:

```

1 2 3 4 5 6 [7] 6 5 4 3 2 1 [0] 1 2 [3] 2 1 0 [-1] 0 1 2 3 4
    [5] [4] 5 6

```

Implement a function `pingpong` that returns the n th element of the ping-pong sequence.

```

1 2 3 4 5 6 [7] 6 5 4 3 2 1 [0] 1 2 [3] 2 1 0 [-1] 0 1 2 3 4
    [5] [4] 5 6

```

5. (Optional) Instead of using nonlocal for pingpong, let's use OOP!

```
>>> tracker1 = PingPongTracker()
>>> tracker2 = PingPongTracker()
>>> tracker1.next()
1
>>> tracker1.next()
2
>>> tracker2.next()
1
```

Bonus points **if** you can get the following syntax.

```
>>> tracker1()
1
>>> tracker1()
2
```

```
class PingPongTracker:
    def __init__(self):
        self.current = 0
        self.index = 0
        self.add = True
    def next(self):
        *** Enter solution below ***
```
