

# ORDERS OF GROWTH

---

## COMPUTER SCIENCE MENTORS 61A

March 7 to March 11, 2016

---

1. In big-O notation, what is the runtime for `foo`?

(a) 

```
def foo(n):  
    for i in range(n):  
        print('hello')
```

(b) What's the runtime of `foo` if we change `range(n)`:

i. To `range(n / 2)`?

ii. To `range(10)`?

iii. To `range(10000000)`?

2. What is the order of growth in time for the following functions? Use big-O notation.

(a) 

```
def strange_add(n):  
    if n == 0:  
        return 1  
    else:  
        return strange_add(n - 1) + strange_add(n - 1)
```

(b) 

```
def stranger_add(n):  
    if n < 3:  
        return n  
    elif n % 3 == 0:  
        return stranger_add(n - 1) + stranger_add(n - 2) +  
            stranger_add(n - 3)  
    else:  
        return n
```

```
(c) def waffle(n):
    i = 0
    sum = 0
    while i < n:
        for j in range(50 * n):
            sum += 1
        i += 1
    return sum

(d) def belgian_waffle(n):
    i = 0
    sum = 0
    while i < n:
        for j in range(n ** 2):
            sum += 1
        i += 1
    return sum

(e) def pancake(n):
    if n == 0:
        return n
    # Flip will always perform three operations and return
    # -n.
    return flip(n) + pancake(n - 1) + pancake(n - 2)

(f) def toast(n):
    i = 0
    j = 0
    stack = 0
    while i < n:
        stack += pancake(i)
        i += 1
    while j < n:
        stack += 1
        j += 1
    return stack
```

3. Consider the following functions:

```
def hailstone(n):
    print(n)
    if n < 2:
        return
    if n % 2 == 0:
        hailstone(n // 2)
    else:
        hailstone((n * 3) + 1)

def fib(n):
    if n < 2:
        return n
    return fib(n - 1) + fib(n - 2)

def slow(n):
    i, j, k = 0, 0, 0
    while i < n:
        while j < n:
            while k < n:
                fib(k)
                k += 1
            fib(j)
            j += 1
        fib(i)
        i += 1

def foo(n, f):
    return n + f(500)
```

In big-O notation, describe the runtime for the following:

- (a) `foo(10, hailstone)`
- (b) `foo(3000, fib)`
- (c) `foo(999999999999, slow)`

4. **Fast Exponentiation:** in this problem, we will examine a real-world algorithm used to improve the speed of calculating exponents.

(a) First, express the runtime of the naive exponentiation algorithm in big-O notation.

```
def exp(b, n):  
    if n == 0:  
        return 1  
    else:  
        return b * exp(b, n - 1)
```

(b) Now, express the runtime of the fast exponentiation algorithm in big-O notation.

```
def fast_exp(b, n):  
    if n == 0:  
        return 1  
    elif n % 2 == 0:  
        return square(fast_exp(b, n // 2))  
    else:  
        return b * fast_exp(b, n - 1)
```

(c) What about this slightly modified version of fast\_exp?

```
def fast_exp(b, n):  
    for _ in range(50 * n):  
        print("Killing time")  
    if n == 0:  
        return 1  
    elif n % 2 == 0:  
        return square(fast_exp(b, n // 2))  
    else:  
        return b * fast_exp(b, n - 1)
```

5. **Mysterious loops:** What is the order of growth in time for the following functions? Use big-O notation.

(a) `def mystery(n):`  
     `for i in range(n):`  
         `while i % 2 != 0:`  
             `print(i)`  
             `i = i - 1`  
     `print("Done")`

(b) `def fun(n):`  
     `for i in range(n):`  
         `for j in range(n * n):`  
             `if j == 4:`  
                 `return -1`  
     `print("Fun!")`

6. **Orders of Growth and Trees:** Assume we are using the non-mutable Tree implementation introduced in discussion. Consider the following function:

```
def word_finder(t, n, word):
    if label(t) == word:
        n -= 1
        if n == 0:
            return True
    for child in children(t):
        if word_finder(child, n, word) == True:
            return True
    return False
```

- (a) What does this function do?

Hint: A path is a sequence of connected nodes. For example, here are four paths in the tree below:  $1 \rightarrow 2$ ,  $1 \rightarrow 3 \rightarrow 4$ ,  $1 \rightarrow 3 \rightarrow 5$ ,  $1 \rightarrow 3 \rightarrow 6$

- (b) If a tree has  $n$  total nodes, what is the total runtime for all searches in big-O notation?

**7. Orders of Growth and Linked Lists:** Consider the following linked list function:

```
def insert_at_end(lst, x):  
    if lst.rest is Link.empty:  
        lst.rest = Link(x)  
    else:  
        insert_at_end(lst.rest, x)
```

(a) What does this function do?

(b) Say we want to repeatedly insert some numbers into the end of a linked list:

```
def insert_many(lst, n):  
    for i in range(n):  
        insert_at_end(lst, i)
```

i. Assume `lst` is initially length 1. How long will it take to do the first insertion? The second? The  $n$ th?

ii. In big-O notation, What is the total runtime to do all the inserts? (total runtime of `insert_many`)
