

## COMPUTER SCIENCE MENTORS 61A

April 17 to April 21, 2017

---

### 1 Creating Tables, Querying Data

---

Examine the table, `mentors`, depicted below.

Name	Food	Color	Editor	Language
Tiffany	Thai	Purple	Notepad++	Java
Diana	Pie	Green	Sublime	Java
Allan	Sushi	Orange	Emacs	Ruby
Alfonso	Tacos	Blue	Vim	Python
Kelly	Ramen	Green	Vim	Python

1. Create a new table **mentors** that contains all the information above. (You only have to write out the first two rows.)

**Solution:**

```
create table mentors as
  select 'Tiffany' as name, 'Thai' as food, 'Purple' as
    color, 'Notepad++' as editor, 'Java' as language
  union
  select 'Diana', 'Pie', 'Green', 'Sublime', 'Java' union
  select 'Allan', 'Sushi', 'Orange', 'Emacs', 'Ruby'
  union
  select 'Alfonso', 'Tacos', 'Blue', 'Vim', 'Python'
  union
  select 'Kelly', 'Ramen', 'Green', 'Vim', 'Python';
```

2. Write a query that lists all the mentors along with their favorite food if their favorite color is green.

Output:

Diana|Pie

Kelly|Ramen

**Solution:**

```
select m.name, m.food
  from mentors as m
 where m.color = 'Green';
```

Without aliasing:

```
select name, food
  from mentors
 where color = 'Green';
```

3. Write a query that lists the food and the color of every person whose favorite language is NOT Python.

Output:

Sushi|Orange

Pie|Green

Thai|Purple

**Solution:**

```
select m.food, m.color
  from mentors as m
 where m.language <> 'Python';
```

Without aliasing:

```
select food, color
  from mentors
 where language != 'Python';
```

4. Write a query that lists all the pairs of mentors who like the same language. (How can we make sure to remove duplicates?)

Output:

Kelly|Alfonso

Tiffany|Diana

**Solution:**

```
select m1.name, m2.name
from mentors as m1, mentors as m2
where m1.language = m2.language and m1.name > m2.name;
```

5. Write a query that has the same data, but alphabetizes the rows by name. (Hint: Use order by.)

Output:

Alfonso|Tacos|Blue|Vim|Python

Allan|Sushi|Orange|Emacs|Ruby

Diana|Pie|Green|Sublime|Java

Kelly|Ramen|Green|Vim|Python

Tiffany|Thai|Purple|Notepad++|Java

**Solution:**

```
select * from mentors order by name;
```

## 2 Fish Population

The 61A mentors want to start a fish hatchery, and they need your help to analyze the data they've collected for the fish populations! Also, running a hatchery is expensive – they'd like to make some money on the side by selling some seafood (only older fish of course) to make delicious sushi.

The following table contains a subset of the data that has been collected. The SQL column names are listed in brackets. Note: we must be able to extend your queries to larger tables! (i.e, don't hard code your answers)

Table name: `fish*`

Species [species]	Population [pop]	Breeding Rate [rate]	\$/piece [price]	# of pieces per fish [pieces]
Salmon	500	3.3	4	30
Eel	100	1.3	4	15
Yellowtail	700	2.0	3	30
Tuna	600	1.1	3	20

\*(This was made with fake data, do not actually sell fish at these rates)

### 6. Aggregation

- (a) Profit is good, but more profit is better. Write a query to select the species that yields the most number of pieces for each price. Your output should include the species, price, and pieces.

**Solution:**

```
select species, price, MAX(pieces) from fish GROUP BY
price;
```

- (b) Write a query to find the three most populated fish species.

**Solution:**

```
select species from fish order by -pop LIMIT 3;
```

- (c) Write a query to find the total number of fish in the "ocean." Additionally, include the number of species we summed. Your output should have the number of species and the total population.

**Solution:**

```
select COUNT(species), SUM(pop) from fish;
```

(d) Business is good, but a bunch of competition has sprung up! Through some cunning corporate espionage, we have determined that one such competitor plans to open shop with the following rates:

Table name: competitor

Species [species]	\$/piece [price]
Salmon	2
Eel	3.4
Yellowtail	3.2
Tuna	2.6

Write a query that returns, for each species, the difference between our hatchery's revenue versus the competitor's revenue for one whole fish. For example, the table should contain the following row:

Salmon | 60

Because we make 30 pieces at \$4 a piece for \$120, whereas the competitor will make 30 pieces at \$2 a piece for \$60. Finally, the difference is 60. Remember to do this for every species!

**Solution:**

```
select fish.species, (fish.price - competitor.price) *
pieces
from fish, competitor
where fish.species = competitor.species;
```

7. **Recursive Select** Suppose these fish breed every day. The population of each fish gets multiplied by its breeding rate every year. Write a recursive select function that creates a table of fish 10 years from now.

**Solution:**

```
with
yearly_pop(yearly_species, yearly_pop, N) as (
  select species, pop, 0 from fish union
  select yearly_species, yearly_pop * rate, N + 1
  from yearly_pop, fish
  where yearly_species = species and N <= 10
)
```

```
select yearly_species, yearly_pop from yearly_pop where N =  
10;
```
